

Marketing Strategy Playbook

Business rules and recommendation principles for the AI campaign advisor.

1. Purpose

This playbook defines how the marketing recommendation engine should translate campaign history into business guidance. It is written as an internal strategy document that a RAG assistant can retrieve when explaining why a channel, budget or campaign priority was recommended.

2. Operating principles

- Prioritize ROI when the business objective is efficiency or sales.
- Prioritize engagement when the business objective is awareness, launch learning or audience discovery.
- Use conversion rate as a quality signal, but avoid recommending a channel solely because of conversion if reach is weak.
- Treat low-support combinations as exploratory: cap budget until live feedback confirms performance.
- Refresh benchmarks monthly or whenever the dataset receives a substantial new batch of campaigns.

3. Channel role definitions

Channel	Primary role	Recommended use
Instagram	High-intent visual discovery	Product Launch, Fashion, Health, Technology; strong for creative testing and high engagement concepts.
Facebook	Broad reach and retargeting support	Market Expansion, Brand Awareness and audience broadening across mature segments.
Twitter	Fast feedback and topical campaigns	Awareness bursts, launch conversations and short-cycle campaigns requiring rapid iteration.
Pinterest	Visual inspiration and consideration	Use selectively; performance in the provided dataset is weaker, so apply caps and test before scaling.

4. Recommended analysis grain

The primary recommendation grain should be Customer_Segment + Campaign_Goal + Target_Audience. Channel_Used is the decision option, while ROI, Conversion_Rate, Engagement_Score, Clicks and Impressions are evaluation signals.

5. Example business rule

For a Technology Product Launch campaign, start with the highest-scoring channel by ROI and engagement. Allocate 45%-55% of the test budget to the top channel, 25%-35% to the second channel, and reserve 10%-20% for exploration. Lower the allocation if historical support is below 500 campaigns for the same segment-goal-channel combination.

6. Governance notes

- Every recommendation should display the data slice used to generate it.
- The assistant should disclose when a recommendation is based on a proxy or synthetic benchmark.
- The system should never claim causal lift unless an experiment or holdout test exists.

- Budget recommendations should be treated as planning guidance, not automatic spend authorization.
